On line 352 of /sites/all/modules/custom_category/custom_category.module \$this->do_categories_check(); custom_category is used here, so the bug does not exist on core, but it does. Go to your customisations or custom_category_category_update_form_submit() function on line 119 \$this->variable = array(); foreach(\$this->form_state['values']['categories'] as \$cat => \$category) { // do some other code if (\$category['category_name'] == \$category_slug) { \$this->variable['\$category_slug'] = \$category['category_name']; } } \$this->variable['category_slug'] and \$category['category_name'] are null, you check them for a value and set it to the same value. This can only cause an error. Fixing this is a bit tricky. You'll have to look at your customisations, to find if there is a customisation that changes the custom_category_category_update_form_submit() function. If there is, you'll need to change the line \$this->variable['\$category_slug'] = \$category['category_name']; to \$this->variable['\$category_slug'] = \$category['category_name']; elsewhere on line 119 of /sites/all/modules/custom_category/custom_category.module package com.gotenna.sdk.subscription; import android.os.Bundle; import androidx.appcompat.app.AppCompatActivity; import android.view.Menu; import android.view.MenuItem; import androidx.core.app.Fragment;
