## SysTools Driver Viewer (April-2022)

The easy-to-use little program SysTools Driver Viewer for Windows allows you to browse for drivers and display detailed information on your system. It's designed to be able to display all installed drivers from a single glance. It's very simple, is completely free, and installed quite rapidly so you can get started instantly without any pitfalls. First of all, the program has a very intuitive interface that's simple to understand. All the information on the system's drivers and hardware is presented in a tree view, which you can easily expand and contract. This design makes it possible to rapidly scan your computer and to see a full record of all installed drivers. You can move quickly to the specific driver from the tree view, which is done with the mouse. When the driver is selected, you can instantly see the information you need about that specific device. The tool lists all elements of the driver, such as the file name, file version, class and class package, serial number, license and update status, manufacturer, vendor, and a list of hardware IDs, all of which are added by the device's manufacturer. You also get a list of drivers with the same serial number, the first from the list. What's interesting is that the information is presented in an entirely automatic manner. For example, when you launch the program, the tree view is automatically updated as soon as new hardware is detected. It will no longer require any manual intervention. Of course, you can also use the program to view the details for a specific driver. Here you get the same kind of overview you get for all drivers, but in more detail. All the elements available for the program's tree view are displayed. Here's what you get in addition to the information you get from the collection of drivers. Drivers are classified according to type, manufacturer, the device serial number (a unique number assigned to the driver), class and class package. This information can be useful for identifying the installed drivers, especially in the case of drivers related to hardware. Installing new software is another useful feature. The program checks the list of installed drivers and compares them with the list of drivers from the currently installed driver packages. Here the system will install any matching drivers automatically. In addition, if the version of the currently installed driver is outdated, the installation procedure will check if it is possible to install the new version, and if so, it will do so automatically.
